by Julie Brown, PhD Economics, Taylor & Francis Grading more than 6 months, 7-12 years Maths 10 students will work through problems from the Text, solving problems from Text A on two different occasions. The students will practice and improve their mathematical thinking and working skills through direct problem solving, modelling and elimination. Text B is largely self-study, and will explore aspects of mathematical thinking that cannot be easily demonstrated by problem solving. These are considered to be 'higher order' skills. The class is set up to expose students to a range of Mathematical ideas and procedures. It is expected that students will use their newly gained skills and knowledge in a wide range of new situations,

particularly those that may arise in the field of business. There are challenges, extensions and discussions in the final stage of the semester. To address these a range of different instructional methods are employed including computer based study, group work, reading and mathematical enquiry. The class is highly interactive, with some students presenting the class with problem situations and using the range of problem solving methods available to them. Students will be able to access and use the resources available to them through the Centrelink Student Portal and be able to access these resources using their classroom computers. 2 The class is set up to expose students to a range of Mathematical ideas and procedures.
